

Heat sinks (mainly made by aluminum or copper) is a kind of metal contain high thermal dissipation ability, light weight and easy for machining. It is one of the popular heat dissipation products and can stick on the surface of heat source. How to increase the thermal conductivity and heat dissipation surface in order to increase the product's heat dissipation efficiency challenging. Stamping, extrusion, die casting and forging are the way of producing heat sinks. These products can be the main components of heat dissipation and/or their structured shell for various applications.
